Installation

After downloading the file from Themeforest, You will find SuperProps.zip file. Then unzip the SuperProps.zip and run the following commands on SuperProps folder to get started with the project.

```
yarn
```

```
yarn next-dev
```

NextJs Server will start in `localhost:3000`

Available routes are below

```
/app
/appmodern
/appclassic
/appminimal
/saas
/saasmodern
/saasclassic
/saasminimal
/saasminimal2
/hosting
/hostingmodern
/portfolio
/ride
/crypto
/cryptomodern
/charity
/interior
/agency
/agencymodern
/agencydigital

...
```

Folder Structure

```
/packages
    /landing [NextJs version of the project]
```

Stack We Have Used

1. Lerna (A tool for managing JavaScript projects with multiple packages. https://lernajs.io)
2. Yarn Workspace
3. React Js and Next Js
4. Styled System and Styled Components
5. Firebase Deployment.
6. Vercel Deployment.

Development

Follow the below procedure to go with the development process.

NextJs

For example, You want to work with 'app' template .

1. Go to `/landing/pages/`
2. now copy all the content from `app.js`
3. Paste all the content in `/landing/pages/index.js`

Now for cleaning the unused code in your project follow the below procedure.

1. Now you can delete all other pages except `_app.js`, `_documents.js` and `_error.js`. That mean in your `/pages` folder you will have four files `index.js`, `_app.js`, `_documents.js` and `error.js`
2. From `/landing/containers/` folder you can delete all other folder except `App` and `Error`
3. From `/common/assets/image/` folder you can delete all other folder except `app`. Do not delete any files from there like `404.svg`, `error.svg` etc.
4. From `/common/data/` folder you can delete all other folder except `App`.
5. From `/common/theme/` folder you can delete all other folder except `app`. Do not delete the `index.js` file.

To start the server for `nextjs` you have to run `yarn nextjs-dev` and the server will start on `locahost:3000`.

Explaining Containers

In the `containers` directory you will get folder for our every template. If you want to use App template. Then in the `App` directory you will get folders containing different section of the template like `Banner`, `Footer`, `Testimonial`, `Navbar` etc.

All of these containers contains regular reactjs code.

Deployment

For deploying your final project you have to build your project first. To build the project you have to follow below procedure.

NextJs

To build the nextjs version run below commands.

```
yarn next-build

// To check the build version locally run below command
// Not necessary if you don't want to check on your local.

yarn next-start
```

Running with Docker

To run the SuperProps Next.js app in docker

```
yarn next-export
docker build -t superprops/landing-next -f ./packages/landing/Dockerfile .
docker run -it -p 3000:3000 superprops/landing-next:latest
Open http://localhost:3000
```

Deployment Support

vercel.com

NextJs

For deploying nextjs on vercel.com go to `packages/landing`. Now run below command .

```
vercel
```

> **Make sure you have `vercel-cli` installed in your system.**

Firebase

NextJs

1. yarn build
2. Check and Update firebase.json file from `packages/landing` directory.

```
{
  "hosting": {
```

```
      "source": ".",
      "ignore": [
        "firebase.json",
        "**/.*",
        "**/node_modules/**"
      ],
      "frameworksBackend": {
        "region": "us-east1"
      }
    }
}
```

3. Update next.config.js file output: "export"

```
const withPlugins = require('next-compose-plugins');

const nextConfig = {
  // distDir: '../../dist/functions/next'
  images: {
    domains: ['pbs.twimg.com'],
    unoptimized: true
  },
  output: "export"
};

module.exports = withPlugins([], nextConfig);
```

4. Download Firebase CLI using this command and login

```
npm install -g firebase-tools
firebase login
```

5. Initiate your project

```
firebase init
```

```
This process showing automatically. You need to select Y/n

Are you ready to proceed? Yes
Which Firebase features do you want to set up for this directory? Press
Space to select features, then Enter to confirm your choices. Hosting:
Configure files for Firebase Hosting and (optionally) set up GitHub Action
deploys
Detected an existing Next.js codebase in the current directory, should we
use this? Yes
```

```
    In which region would you like to host server-side content, if applicable?
    us-east1 (South Carolina)
    ? Set up automatic builds and deploys with GitHub? No
```

6. Final Step Deploy Project

```
firebase deploy
```

Netlify

At first, open an account on netlify and go to `sites` tab.

NextJs

Run the below command to make the project netlify deploy ready from `packages/landing`.

```
yarn export
```

After running the above command go to `/landing` folder. You will find a `out` folder there. Drag and drop this `out` folder on netlify `sites` tab. Now after finishing the upload you are ready to go.
